Berkeley, CA | adithm@berkeley.edu | (925)-967-6184 | linkedin.com/in/adithmohanty | adithmohanty.com

EDUCATION

University of California, Berkeley

Aug 2023 - May 2027

B.A. Data Science, B.A. Applied Mathematics

Coursework: Data Structures, Efficient Algorithms, Database Systems, Computer Security, Computer Networking, Linear Algebra, Artificial Intelligence, Machine Learning, Optimization Models, Probabilistic and Learning-Based Navigation for Physical AI

EXPERIENCE

IBM

May 2026 – Aug 2026

Software Engineer Intern

San Jose, CA

- Built a distributed evaluation harness library in Python to run 30 concurrent multi-turn agent trajectories against IBM's ZDBA for DB2 at up to 6,000 questions/hour, cutting manual review time from days to 2 hours
- Designed a model-based grader on watsonx (gpt-oss-120b) combining rubric-based scoring and pairwise comparison across response attributes, using a reason-before-score contract and temperature-0 decoding for deterministic, reproducible scores
- Extended the grader to assess tool-call efficiency against SME-defined expected calls, uncovering that only 82% of trajectories used tools efficiently versus a 95% estimate, and fed flagged trajectories into the engine's early-stopping logic to halt downstream turns
- Validated the grader against a 12,000-question, 15-agent dataset, establishing ground-truth benchmarks at 90% agent accuracy

DealMover.ai

March 2026 – May 2026

Software Engineer Intern

Remote

- Built an LLM classification pipeline (Llama 3 via Ollama) that auto-sorts and tags uploaded lending documents by type and purpose using scope-aware prompts and a keyword fast-path, cutting LLM inference calls and reducing GPU compute costs by 50%
- Built a multi-agent extraction pipeline that parsed 200+ earnings reports and financial documents, correctly extracting income-statement, balance-sheet, and qualitative deal data 95% of the time, and populated 100+ structured fields per canonical schema
- Implemented the formula logic linking populated financial line items to auto-calculated derived metrics like EBITDA, designed to adapt correctly across varying company cost structures without manual reconfiguration

Cisco Systems

May 2025 – Aug 2025

Software Engineer Intern

San Jose, CA

- Implemented LDAP authentication with role-based access control (RBAC), separating manager and engineer permissions so managers could securely reassign and audit test-suite ownership across the 40+ person build/infra team
- Built and deployed a full-stack release-management platform on Kubernetes (Django REST backend, React, PostgreSQL) that aggregated regression runs and test-suite results per release into a single view, cutting manual release monitoring
- Diagnosed slow legacy SQL queries and added Redis caching, cutting dashboard load times from several seconds to 100ms

Reyes Coca-Cola Bottling

Dec 2024 – Mar 2025

Machine Learning Engineer (Contract)

Berkeley, CA

- Developed sentiment analysis models using VADER NLP, LDA topic modeling, and TF-IDF vectors to assess market trends and optimize sales forecasting, training on 10k+ consumer records scraped from X, Reddit, and Google via SerpApi and Python scrapers
- Decreased forecast error (MAPE) by 20% by building a streaming ETL pipeline with Kafka and AWS SQS that fed live consumer sentiment data into the forecasting model, enabling more informed supply chain decisions
- Trained models on Berkeley GPU clusters using SLURM scheduling and deployed inference on CUDA-enabled servers

PROJECTS

RL Arm Control | Python, PyTorch, MuJoCo, Gymnasium, Reinforcement Learning

- Built a simulated robot arm in MuJoCo with a classical control baseline (hand-derived forward and inverse kinematics, torque-limited PD joint controllers), and tuned the contact and friction physics so grasps held reliably during pick-and-place
- Trained PPO and SAC agents in a Gymnasium environment, using a staged reward (reach, grasp, lift, deliver) that builds up to multi-object pick-and-place, then benchmarked them against the baseline on success rate, time to finish, and motion smoothness

SKILLS

Languages: Python, TypeScript, JavaScript, C++, C, Go, Java, SQL

Frameworks: Django, Flask, React, Node.js, Next.js, Tailwind CSS, PyTorch, TensorFlow, Scikit-learn, LangChain, GraphQL

AI/ML: Machine Learning, LLM Evaluation, RAG, Agents, Computer Vision, Reinforcement Learning, Vector Databases

Tools: AWS, Kafka, Redis, PostgreSQL, Firebase, Kubernetes, Docker, OpenCV, Celery, Linux, Shell scripts, SLURM, CUDA, Pandas, NumPy, SciPy, Matplotlib, ELK Stack, Git, Github
